Pollination

To make a seed that could grow into a new plant, a special powder that the plant makes, called **pollen**, needs to move from the stamen to the stigma. This is called **pollination**. Sometimes plants can pollinate themselves, which we call **self-pollination**.

But sometimes plants need some help.
How do insects help with pollination?

Once a seed has been made, it will need the right amount of light, air and water to grow into a new plant. But it will also need its own space. How do some plants find space?

Insects like bees drink nectar from the center of the plant. The pollen sticks to them while they are moving around. Spreading from the stamen to the stigma. Some plants pollinate through seed dispersal. A seed to find space by being blown in the wind. Heavy seeds drop and roll. Some seeds are taken to space by animals like

The crow tale 24.6.25

Long time ago there lived some animals
and they were friends they were being
hot & they wish they had some
cold they were sweating for days
and days.

They ^{said} ~~careful~~ around and they ^{said} ~~sed~~ we
need a plan somebody ~~has~~ ^{has} to go
to get ~~some~~ ^{some} cold water here becus it's
being hot.

The crow went to the clouds clouds
he had to ~~wait~~ ^{could} ~~wait~~ ^{wait} and he's
to ~~wait~~ ^{wait} to die.

The crow asked if he ~~could~~ ^{could} ~~have~~
some cold becus I live in a ~~hot~~
hot place the ^{cloud} cold sed ~~is~~
Fine! ~~yes~~.

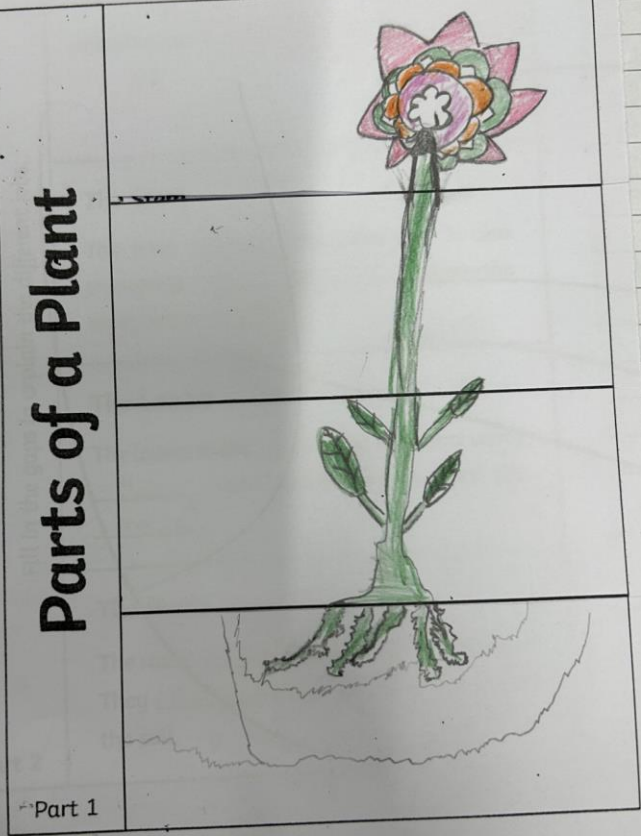

said said

When the crow arrived he was as wire
as an egg & he was dehydrated
and sad. white white

The animals were telling worid as
about about crow until he arrived
finally. about about

His friends sed we are you ching?
he ^{said} sed becus im white work on your
it does not matter about the outside
it matters about the inside.
